# Confidentiality and Copyright

---

- Case studies are real and may be recognisable, so please do not repeat them
- Data and slides used in this presentation may belong to other institutions, particularly:
  - Loughborough University
  - Serious Hazards of Transfusion (SHOT)
  - Kings College London University
- Slides may contain pictures or other items that are copyrighted. These are attributed where known, but should not be used for anything other than personal education

# Summary of presentation

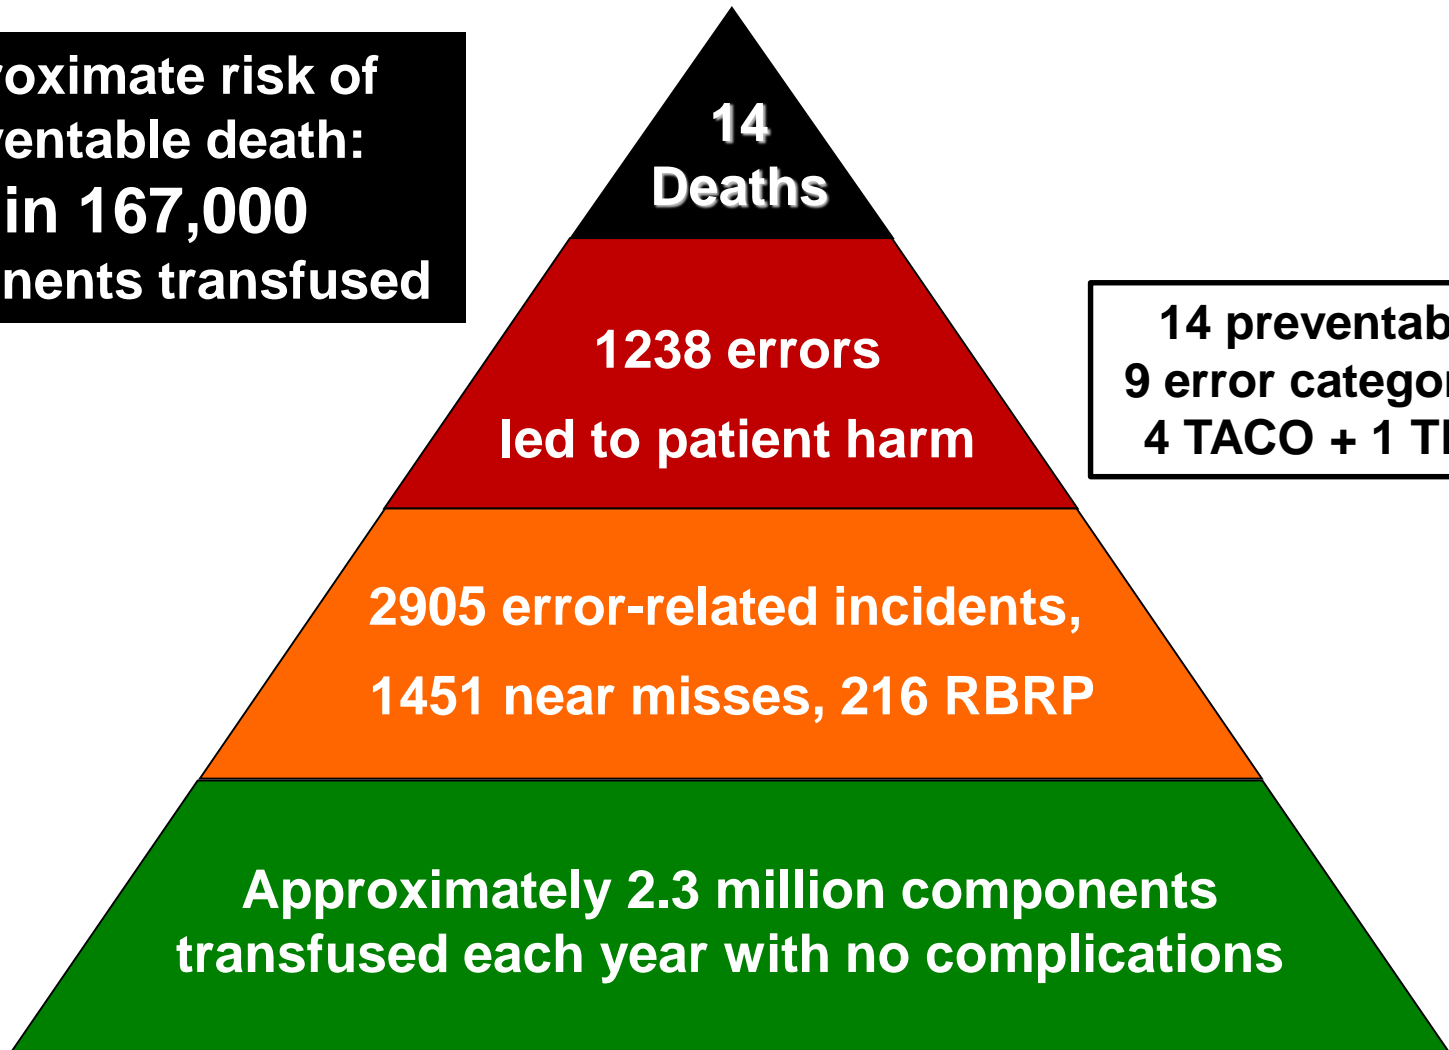

---

- Why is research needed into human factors and transfusion
- Outline of five years HF research in transfusion
- Introduction to some common HF terms
  - Resilience engineering
  - Work-as-imagined (WAI) and work-as-done (WAD)
  - Safety-I and Safety-II
- Real case studies, plus illustrative examples from life
- Conclusions and summary of lessons learnt

# Risks of error in transfusion in UK (2018)

Approximate risk of  
preventable death:  
**1 in 167,000**  
components transfused

14 preventable =  
9 error categories +  
4 TACO + 1 TRALI

**Jarobe**  
Healthcare Human Factors

# Think about the daftest thing you've ever done

---

Ever lost your car in a large car park?

What really caused your error?

# Reason for transfusion HF research

---

- SHOT key recommendation in 2013  
Annual SHOT Report, published 2014

- Process redesign: Annual SHOT data consistently demonstrate errors to be the largest cause of adverse transfusion incidents. In line with human factors and ergonomics research it may be better to redesign the transfusion process by process mapping and audit at local and national level, to design out the medical errors

**Action: National Blood Transfusion Committees, working with Regional and Hospital Transfusion Committees in association with NHS England patient safety domain and equivalent organisations in the devolved countries and the National Comparative Audit Programme**

# Three transfusion HF studies

---

1. Retrospective analysis of historical SHOT incident reports using 7 known HF models
2. Creation and use of a human factors investigation tool (HFIT)
3. Prospective analysis of resilience in the hospital setting

# Study 1

## Retrospective assessment

---

Analysis of historical incidents from SHOT reports made in 2014 (n=76)

- Incorrect blood transfusion (IBCT) (n=36)
- Similar near miss (NM) cases, where the error was detected before the transfusion took place (n=40)

# Study 1: Results

Existing incident reports often had insufficient HF information to make a subcategorisation

# Study 1: Summary

---

**None of the HF models was suitable**

In all seven models the outcome was a tendency to place responsibility for errors on individuals

# Study 2: HF Investigation Tool (HFIT)

---

In January 2016 a human factors investigation tool (HFIT) was added to the SHOT database. Reporters were asked to assess each factor from **0**=no contribution, to **10**=fully responsible

- **Staff:** Unsafe practice by individuals
- **Environment:** Unsafe local environment or workspace
- **Organisation:** Unsafe organisational/management conditions in the Trust/Health Board
- **Government/Regulatory:** Conditions in government, Department of Health or high level regulatory issues

# Study 2: Scores decrease as system and organisational factors become more remote from the individual (2016)

---

[www.shotuk.org](http://www.shotuk.org)

Loughborough  
University

NERTC  
17 Oct 2019

# Self-learning

---

- Jan 2017 added a PowerPoint self-learning package to help reporters score the HF aspects of transfusion incidents
- Jan 2018 added a link to a video and updated the self-learning package
- Statistical analysis concluded self-learning led to:
  - A small reduction in attributing staff as a cause of an incident
  - Strong evidence of an increase in scoring environment, organisation, and regulation as contributing to the incident

# Effect of self-learning (2016-18)

# Playing the blame game

- In studies using James Reason's decision tree for determining the culpability of unsafe acts:  
90% are designated as blameless, 10% culpable

# **Study 3: Resilience or How do you keep the process going when things go wrong?**

# Demonstration of resilience

---

When you walk through a crowd, how often do you make minor adjustments to avoid bumping into people?

# Resilient Health Care (RHC)

---

- RHC refers to the application of Resilience Engineering (RE) principles in health care\*
- Resilience engineering is about systems, not just building personal or team resilience
- Understanding how people adapt to get the work done should improve health care systems - better than concentrating on improving the resilience of individuals within the system

\*Sujan, M.A., Furniss, D., Anderson, J., Braithwaite, J. and Hollnagel, E., 2019. Towards a Syllabus for Resilient Health Care. In: Proceedings of the 29th European Safety and Reliability Conference.

# **Work-as-imagined (WAI) compared to Work-as-done (WAD)**

# Definitions WAI v WAD

---

**“Work-as-imagined (formal work)  
is what designers, managers, regulators, and  
authorities believe happens or should happen”**

**“Work-as-done (informal work)  
is what people have to do to get the job done.  
It is what actually happens”**

Healthcare Human Factors

# Transfusion process resilience

---

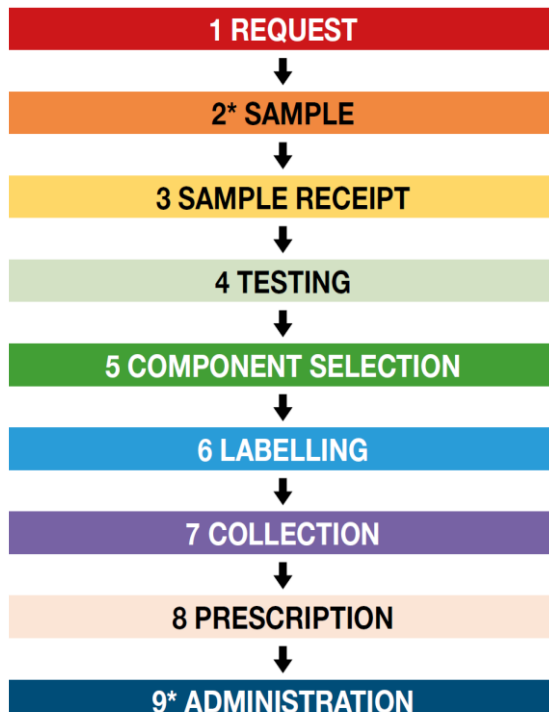

- Method = walk through the transfusion process in 4 hospitals asking staff:  
“Please give a short outline of the biggest or most recent difficulty that you have faced when carrying out this procedure and what did you do about the issue?”
- All staff questioned (n=59) gave at least one example of a problem/adaptation and several gave more than one (n=99)

Based on: Sujan et al., 2011: Hassle in the dispensary: pilot study of a proactive risk monitoring tool for organisational learning based on narratives and staff perceptions. Quality and Safety in Health Care

# Prospective review of resilience

Adaptations were seen at every stage of the nine-step transfusion process (total n=99)

Stage of the transfusion process

# Audit magic!

---

- That open question encourages staff to describe adaptations – they magically tell you the problem and how they solved it
- Changes are commonly forced on staff if they feel they have to adapt to get the job done, i.e. work-as-done (WAD)
- Sometimes adaptations are a resilient improvement on the standard process, i.e. WAD matches work-as-imagined (WAI)

# What is an adaptation?

---

If you can't find a  
screwdriver...

Have you ever used  
a knife instead?

# **Safety-I and Safety-II**

# Definitions Safety-I v Safety-II

---

**Safety-I**  
**as few things as possible go wrong**

Avoiding things that go wrong – Reactive, learning from errors

**Safety-II**  
**as many things as possible go right**

Ensuring things go right – Proactive, learning from what goes well

Hollnagel, E., 2014. Safety-I and safety-II. Farnham. UK: Ashgate

# **Vein to vein (V2V) audit being done in transfusion**

**(Results are from HF questions only)**

# Vein to Vein (V2V)

---

- V2V audit asks traditional clinical audit questions for each of the 9 steps in the transfusion process
- This is a Safety-I approach, searching for things that are going wrong
- The same HF questions are asked at each of the 9 steps to look at adaptations (WAD)
- This is a Safety-II method of examining an organisation's potential for resilience in the transfusion process

# Adaptations are made within sphere of influence of staff

## Preferred adaptations likely to be more resilient

# Forced adaptation

---

You haven't got time  
to sew on a button...

So you use a  
safety pin

# Case study - Forced adaptation

---

- Nurse prescriber, managing transfusion dependent outpatients, assesses need for transfusion and posts a request form for pre-transfusion sample to be taken
- Standard process is for posting to be done by the hospital administration team, but this causes delays
- If urgent transfusion is required, the nurse buys own stamps for posting

# Preferred adaptation

---

You usually go to  
work on a crowded,  
draughty bus

But you have to work  
Xmas Day, so you get  
a personal, warm taxi

# Case study - Preferred adaptation

---

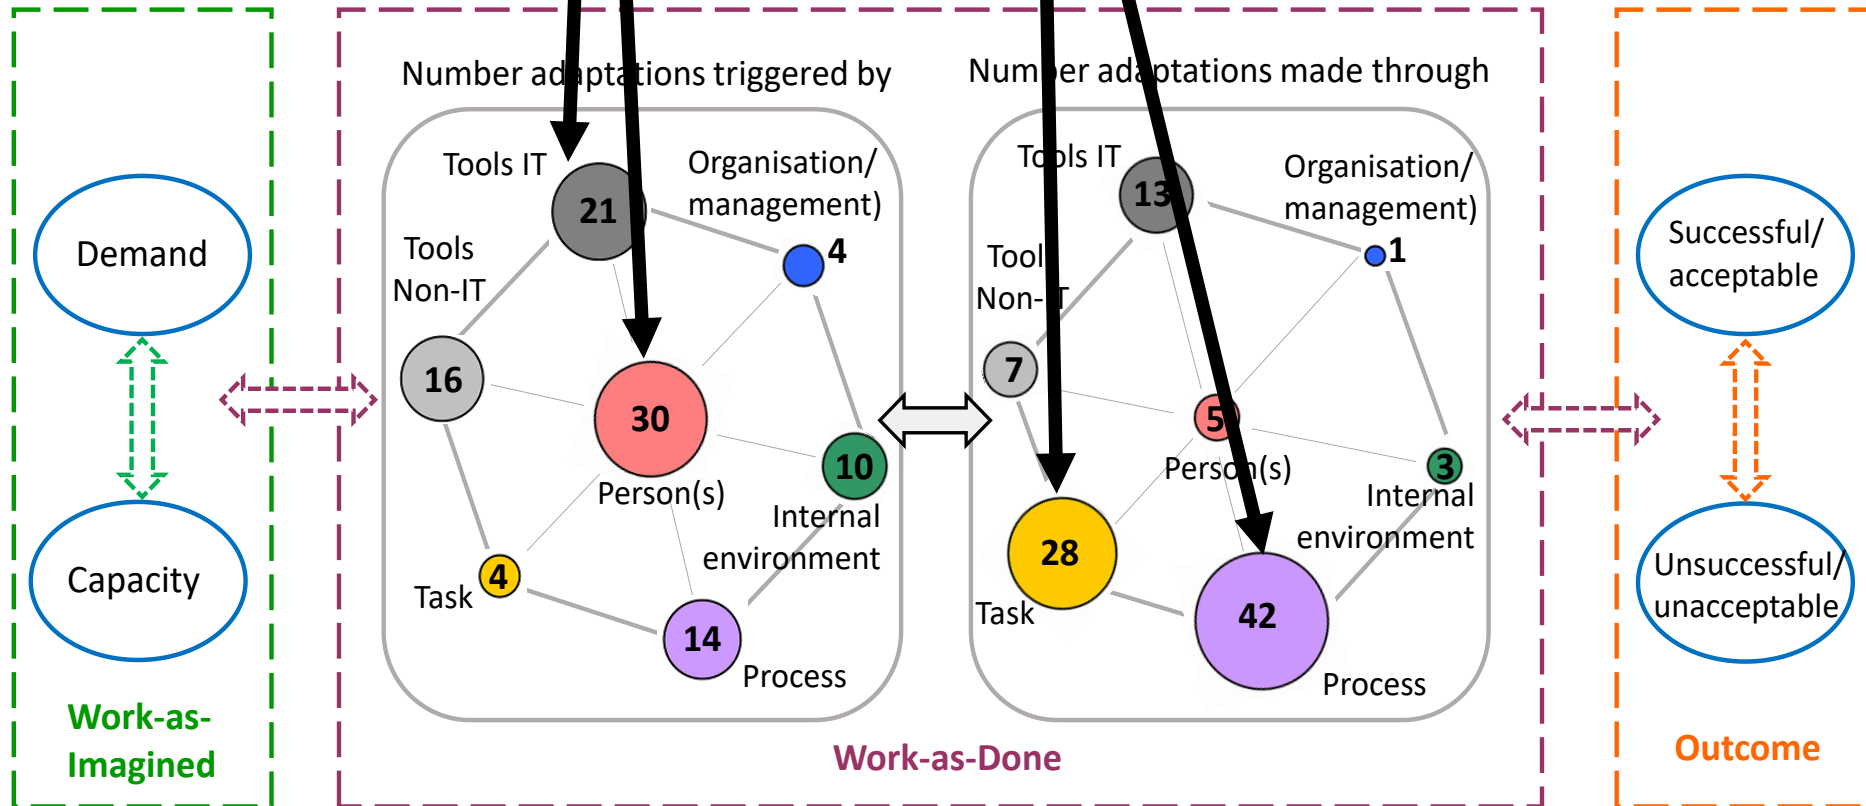

- Patients on the day ward were increasing the flow, so their transfusions finished more quickly
- This puts patients at risk of transfusion associated circulatory overload (TACO) a life-threatening complication
- Introduced programmable pumps to stop patients increasing flow

# Triggers v Adaptations

Triggers: IT & Staff

Task & Process adapted

Watt et al., 2019. Resilience in the blood transfusion process. Safety Science

Loughborough  
University

NERTC  
17 Oct 2019

**Jarobe**  
Healthcare Human Factors

# Adaptations go unnoticed

## Follow up question:

"How supportive was your manager or department for how you solved the issue?"

Graded:

5 - very supportive

1 - very unsupportive

N/A – not applicable

## Outcome:

**N/A n=73, 73.7%**

Adaptations often made without approval from management or colleagues

- Score 0, not applicable - 73 (73.7%)
- Score 1, very unsupportive - 4 (4%)
- Score 2, fairly unsupportive - 2 (2%)
- Score 3, neither supportive/unsupportive - 1 (1%)
- Score 4, fairly supportive - 3 (3%)
- Score 5, very supportive - 16 (16.2%)

Resilience in the blood transfusion process: Everyday and long-term adaptations to 'normal' work

Alison Watt<sup>a,b,\*</sup>, Gyuchan Thomas Jun<sup>a</sup>, Patrick Waterson<sup>a</sup>

<sup>a</sup> Human Factors & Complex Systems Group, Loughborough Design School, UK

<sup>b</sup> Serious Hazards of Transfusion (SHOT), NHS Blood & Transplant, Manchester, UK

Loughborough  
University

NERTC  
17 Oct 2019

# Summary and Conclusions

---

- Human factors and ergonomics is about making it easy to do the right thing
- Incident investigations should look at the system failures, not just the staff

**Ask how, what, why, where, when before asking who**

- If another person could make the same mistake, then the system is at fault, not the person - retraining/reminding seldom works
- Audit what goes right, such as good adaptations, as well as what goes wrong

# Making it easy to do the right thing

---

Red stripe  
on wall so  
emergency  
buzzers can  
be located  
easily

But how  
human, that  
someone  
has stuck a  
piece of  
paper over it

# Many thanks for your attention

---

**“We must accept human error as inevitable - and design around that fact.”**

NERTC  
17 Oct 2019

- Healthcare has only recently started to utilise human factors, compared to industries like aviation that have applied these principles for over three decades
- Jarobe Healthcare Human Factors is a consultancy business that aims to promote an understanding of human factors
- Jarobe's consultant is a highly qualified healthcare scientist with over 30 years experience, specialising in error reduction through research into the application of human factors
- Jarobe offers a flexible range of solutions for healthcare organisations to develop their processes and improve safety through an understanding of human factors
