Implementing NICE guidance

NICE recommendation	Guideline reference	Current activity/evidence	Complies?	Actions needed to ensure compliance
Offer oral iron before and after surgery to patients with iron-deficiency anaemia.	1.1.2	A pilot to identify and correct iron deficiency with oral and IV iron was developed in orthopaedic surgery as part of an ongoing patient blood management programme but has been cancelled. At present correction of pre op anaemia relies on the surgeon and GP taking action at the time of outpatient assessment	No	A formal anaemia screen in advance of surgery would potentially increase the number of patients having iron deficiency corrected prior to surgery
Consider intravenous iron before or after surgery for patients who: <ul style="list-style-type: none"> • have iron-deficiency anaemia and cannot tolerate or absorb oral iron, or are unable to adhere to oral iron treatment (see the NICE guideline on medicines adherence) • are diagnosed with functional iron deficiency • are diagnosed with iron deficiency anaemia, and the interval between the diagnosis of anaemia and surgery is predicted to be too short for oral iron to be effective. For guidance on managing anaemia in patients with chronic kidney disease, see the NICE guideline on anaemia management in chronic kidney disease.	1.1.3	Norfolk CCGs have recently agreed to commission a community based iron service. If this proceeds this will provide a direct access facility for NNUH for any patient who needs IV iron	No	Surgeons/anaesthetists will need to take up this new service
Offer tranexamic acid to adults undergoing surgery who are expected to have at least moderate blood loss (greater than 500 ml)	1.1.4	Compliance with NICE guidance for management of renal anaemia is undertaken by renal department. Not assessed as part of this review	Yes	Management of renal anaemia is already established in the trust. For a breakdown of compliance with this guideline see renal anaemia BAT.
Use restrictive red blood cell transfusion thresholds for patients who need red blood cell transfusions and who do not: <ul style="list-style-type: none"> • have major haemorrhage or • have acute coronary syndrome or • need regular blood transfusions for chronic anaemia. 	1.1.5	Tranexamic acid is used in the perioperative period but is not routinely used in all cases where anticipate dblood loss is greater than 0.5l	No	Could be incorporated as prompt in WHO sign in as EBL forms part of this and a value of >0.5l could trigger a reminder to consider Tranexamic acid
When using a restrictive red blood cell transfusion threshold, consider a threshold of 70 g/litre and a haemoglobin concentration target of 70-90 g/litre after transfusion.	1.2.1	Transfusion targets in trust guideline CA2057 (Transfusion of blood and blood components in adults and children) have been updated in line with NICE. Mandatory training material will be updated to highlight these changes. Current compliance not known	No	A culture change in medical practice is needed. Compliance with this recommendation could be further improved by introducing guidance within the webICE requesting system. The transfusion section of webICE is scheduled for a major revision in 2016. amendments to be deferred until this is done.
Consider a red blood cell transfusion threshold of 80 g/litre and a haemoglobin concentration target of 80-100 g/litre after transfusion for patients with acute coronary syndrome.	1.2.2	As above	No	As above
Consider setting individual thresholds and haemoglobin concentration targets for each patient who needs regular blood transfusions for chronic anaemia.	1.2.3	As above	No	As above
Consider single-unit red blood cell transfusions for adults (or equivalent volumes calculated based on body weight for children or adults with low body weight) who do not have active	1.2.4	Difficult to assess current compliance. It is likely that most transfusion dependant patients with chronic anaemia are managed within the haematology department. There is currently a dedicated nurse transfusion clinic for these cases. Decisions to transfuse are based on both Haemoglobin and symptoms but availability of outpatient blood transfusion slots is also a major factor in determining timing of transfusions. There is not a documented haemoglobin threshold and target for each patient	No	An audit of the nurse led transfusion clinic would establish current compliance. An increase in blood transfusion capacity would be helpful. It is hoped that this will happen when the Weybourne expansion project is completed
Consider single-unit red blood cell transfusions for adults (or equivalent volumes calculated based on body weight for children or adults with low body weight) who do not have active	1.2.5	As above - see 1.2.1. Trust guideline and mandatory training material have been updated to support this	No	Single unit transfusion is rarely used in clinical practice. Major culture change would be needed

Key priorities for implementation

- Alternatives to blood transfusion for patients having surgery
- Red blood cell transfusion
- Patient information

Alternatives to blood transfusion for patients having surgery

- Oral/ IV iron
- EPO
- Tranexamic Acid
- Cell salvage

Intraoperative cell salvage

- Snap shot audit of cell saver use
- Clinical lead for cell salvage

Time out ...

- Anticipated blood loss?
- Anticipated blood loss > 500mls?
- Has the use of tranexamic acid been considered?
- Has the use of cell salvage been considered?

WHO Surgical Safety Checklist
(adapted for England and Wales)

SIGN IN (To be read out loud) Before induction of anaesthesia	TIME OUT (To be read out loud) Before start of surgical intervention for example, skin incision	SIGN OUT (To be read out loud) Before any member leaves the operating room
<p>Has the patient confirmed his/her identity, site, procedure and consent? <input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>Is the surgical site marked? <input type="checkbox"/> Yes/not applicable <input type="checkbox"/> No</p> <p>Is the anaesthesia machine and medication check complete? <input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>Does the patient have a: Known allergy? <input type="checkbox"/> No <input type="checkbox"/> Yes</p> <p>Difficult airway/aspiration risk? <input type="checkbox"/> No <input type="checkbox"/> Yes, and equipment/assistance available</p> <p>Risk of >500ml blood loss (7ml/kg in children)? <input type="checkbox"/> No <input type="checkbox"/> Yes, and adequate IV access/fluids planned</p>	<p>Have all team members introduced themselves by name and role? <input type="checkbox"/> Yes <input type="checkbox"/> No</p> <p>Surgeon, Anaesthetist and Registered Practitioner verbally confirm: <input type="checkbox"/> What is the patient's name? <input type="checkbox"/> What procedure, site and position are planned?</p> <p>Anticipated critical events Surgeon: <input type="checkbox"/> How much blood loss is anticipated? <input type="checkbox"/> Are there any specific equipment requirements or special investigations? <input type="checkbox"/> Are there any critical or unexpected steps you want the team to know about?</p> <p>Anaesthetist: <input type="checkbox"/> Are there any patient specific concerns? <input type="checkbox"/> What is the patient's ASA grade? <input type="checkbox"/> What monitoring equipment and other specific levels of support are required, for example blood?</p> <p>Nurse/ODP: <input type="checkbox"/> Has the sterility of the instrumentation been confirmed (including indicator results)? <input type="checkbox"/> Are there any equipment issues or concerns?</p> <p>Has the surgical site infection (SSI) bundle been undertaken? <input type="checkbox"/> Yes/not applicable • Antibiotic prophylaxis within the last 60 minutes • Patient warming • Hair removal • Glycaemic control</p> <p>Has VTE prophylaxis been undertaken? <input type="checkbox"/> Yes/not applicable <input type="checkbox"/> No</p> <p>Is essential imaging displayed? <input type="checkbox"/> Yes/not applicable</p>	<p>Registered Practitioner: <input type="checkbox"/> Has the name of the patient been confirmed and sharps counts taken? <input type="checkbox"/> Have the specimen containers been labelled (including patient name and date of birth)? <input type="checkbox"/> Have any equipment issues or concerns been addressed?</p> <p>Surgeon, Anaesthetist: <input type="checkbox"/> What are the key elements of the patient's management of the case?</p>

PATIENT DETAILS

Last name: _____
First name: _____
Date of birth: _____
NHS Number: _____
Procedure: _____

*If the NHS Number is not immediately available, a temporary number should be used until it is.

SINGLE Unit Blood Transfusions
reduce the risk of an adverse reaction

**Don't give two
without review**

**Before you transfuse
your patient:**

- What is your patient's current haemoglobin level?
- What is your patient's target haemoglobin level and would this be achieved by transfusing one unit?

**Each unit transfused is an
independent clinical decision**

Clinically re-assess your patient after each unit is transfused.

- ✓ Is your patient still symptomatic?
- ✓ Is further transfusion appropriate?

Only order one unit at a time for non-bleeding patients.
Document the reason for the transfusion.†

Patient information

- Provision of printed information
- Informed consent
- Inclusion of transfusion in EDL
