

# **SHOT and Anti-D**

**- an overview of reports from the  
Serious Hazards of Transfusion scheme**

**Tony Davies – Transfusion Liaison Practitioner  
Cambridge 20<sup>th</sup> Sept 2012**

# Acronym-buster !

- **BSQR** Blood Safety and Quality Regulations 2005
- **MHRA** Medicines & Healthcare products Regulatory Agency
- **SHOT** Serious Hazards of Transfusion
- **SABRE** Serious Adverse Blood Reactions & Events web portal
- **HPA-CI** Health Protection Agency Centre for Infections
- **NPSA** National Patient Safety Agency
- **CQC** Care Quality Commission
- **CPA** Clinical Pathology Accreditation
- **BCSH** British Committee for Standards in Haematology

# SHOT Background

- Serious Hazards of Transfusion (SHOT) is the UK haemovigilance scheme, monitoring errors across the whole spectrum of the transfusion process.
- **Mandatory** reporting to the EU Commission is via the Medicines and Healthcare products Regulatory Agency (MHRA)
- **Voluntary** reporting to SHOT but...

# Haemovigilance in the UK

## MHRA

Medicines & Healthcare Products Regulatory  
Agency

- Competent Authority' for the **BSQR 2005**
  - QMS in blood establishments and hospital blood banks.
- Competent Authority for the **Medicines Act 1968**
- Competent Authority for the **Medical Devices Regulations 2008**
- **STATUTORY** reporting

## SHOT

Serious Hazards of Transfusion

- Confidential enquiry
- Serious adverse reactions/events AND near misses all of which occur in **BOTH** a laboratory and **CLINICAL** environment.
- **PROFESSIONALLY MANDATED** reporting

# SHOT Aims

## Improving patient safety by

- Raising standards of hospital transfusion practice
- Informing policy with UK Blood Services
- Aiding production of clinical guidelines
- Educating users on transfusion hazards and their prevention

# SHOT Reports 2011

- 3435 reports made to the scheme
  - 2768 analysed
    - 204 in an inappropriate category, moved
  - 667 withdrawn (20%)
- + 270 reports made in 2010, but only completed in 2011
- 3038 cases including 'near miss' and 'right blood right patient'

- **ATR** Acute Transfusion Reaction
- **HTR** Haemolytic Transfusion Reaction
- **TACO** Transfusion Associated Circulatory Overload
- **TRALI** Transfusion Related Acute lung Injury
- **TAD** Transfusion Associated Dyspnoea
- **I&U** Inappropriate & Unnecessary (and delayed) tx
- **IBCT** Incorrect blood Component Transfused
- **SRNM** Special Requirements Not Met
- **TAGvHD** Transfusion Associated Graft v Host Disease
- **TTI** Transfusion Transmitted Infection (Hepatitis, HIV, CMV, WNV, bacterial)
- **PTP** Post Transfusion Purpura
- **PUCT** Previously Uncategorised Complication of Trans.
- **WBIT** Wrong Blood in Tube

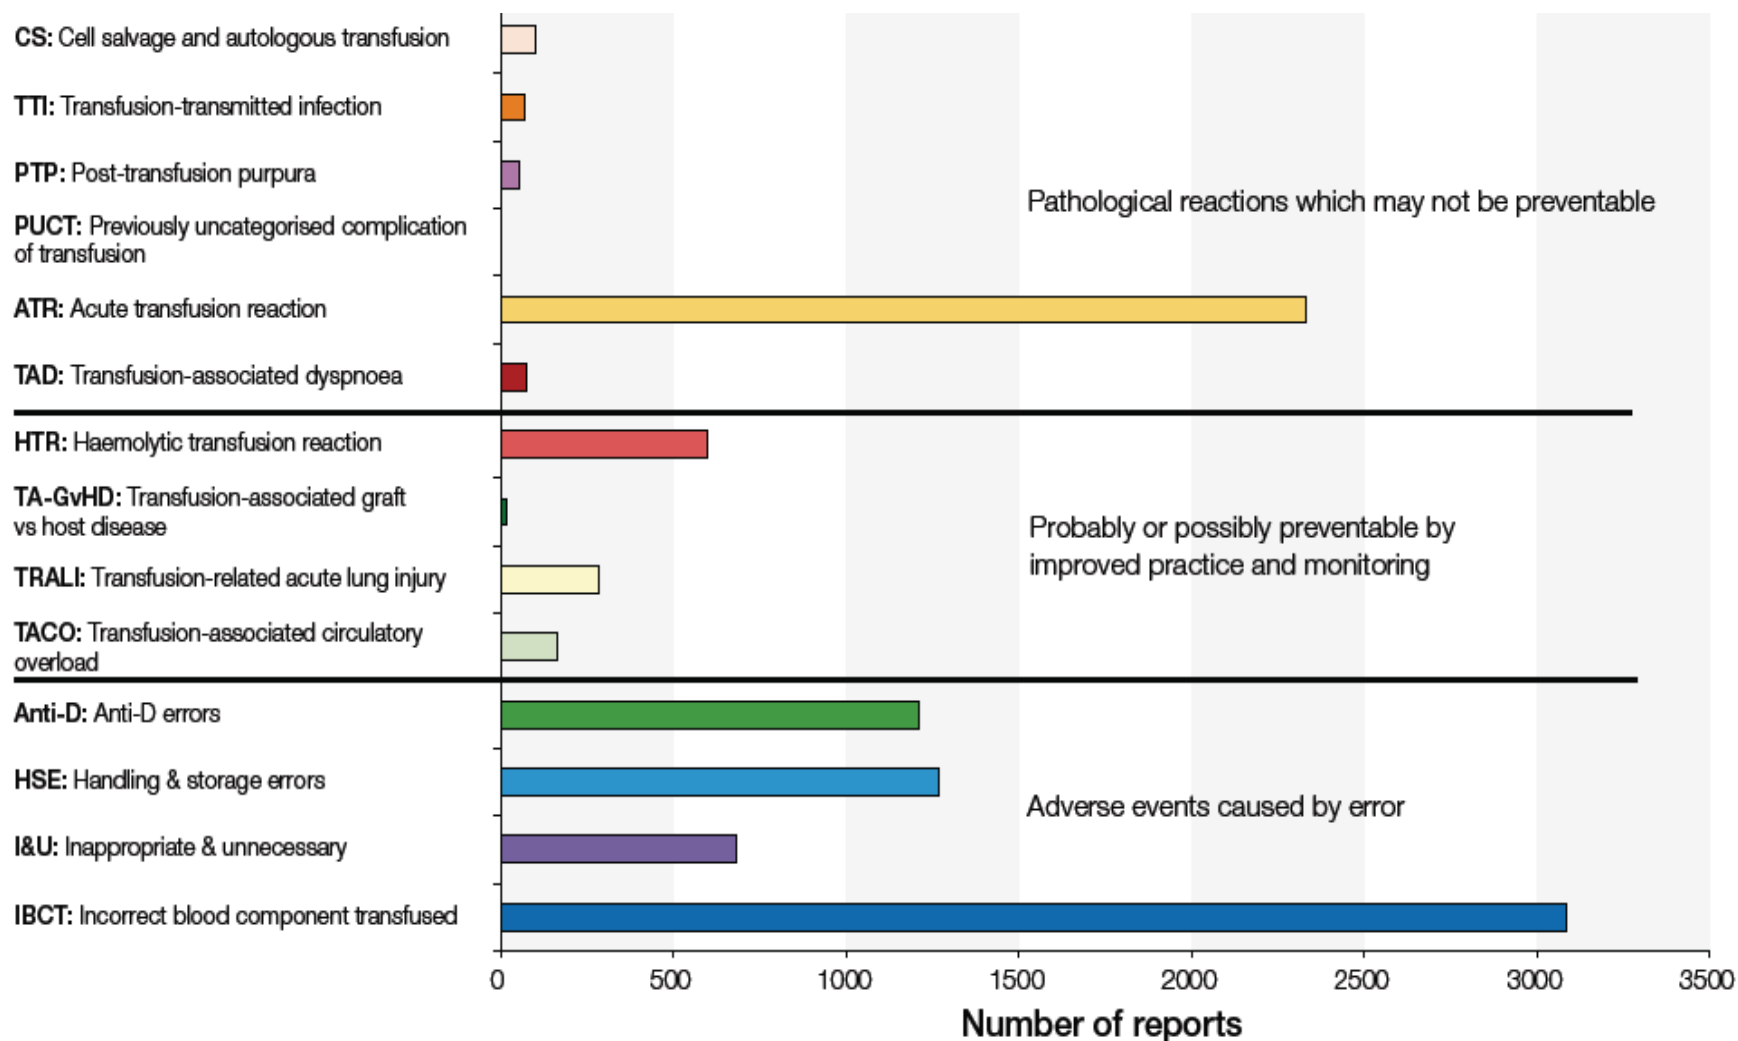

# SHOT reports 2011

\* Excluding NM and RBRP

# Cumulative Reports 1996-2011

# Deaths where transfusion was causal or contributory 2011 (n=8)

**I&U** – Inappropriate & unnecessary transfusion

**ATR** – Acute transfusion reaction

**TRALI** – Transfusion related acute lung injury

**TACO** – Transfusion associated circulatory overload

**PUCT** – Previously uncharacterised complication of transfusion

\* *The PUCT incident was a case of NEC in a baby that is not categorically linked to the transfusion, but is an association that could not be ignored*

# ABO incompatible transfusions

- **12 in 2011 - Listed as a DOH 'never event'**
  - **8 clinical**
    - - 2 WBIT
    - - 6 Administration
  - **4 laboratory**
    - - 1 wrong sample tested
    - - 2 grouping errors
    - - 1 component selection error

# Special requirements in obstetrics

- **RCOG Green Top Guidelines 2007**
  - Use K(-) units for women of childbearing age
- **NICE guidance for Routine Antenatal Anti-D Prophylaxis**
- **SaBTO guidance 2012**
  - Use CMV- units for regular transfusions in pregnancy (ie Haemoglobinopathies)
- **RCOG Green Top Guidelines 2011**
  - Use of anti-D

# Why Anti-D Ig?

Although it is a medicinal blood product rather than a blood component, adverse events associated with anti-D immunoglobulin are included in the annual SHOT report as they provide a useful insight into process errors which may be applied to transfusion as a whole

# Anti-D Ig - the background....

- To prevent Haemolytic Disease of the Newborn (HDN) due to immune anti-D
- Offered to all RhD negative pregnant women who are not known to be sensitised to the RhD antigen
- 500iu of anti-D Ig is capable of suppressing immunisation by 4ml of RhD positive red cells

# Anti-D Ig Prophylaxis

- Post-delivery anti-D Ig prophylaxis began in the UK in 1969
- The programme has been a huge success
- Deaths fell from **46 / 100,000** births pre-1969 to **1.6 / 100,000** births by 1990  
but.....
- RhD alloimmunisation continues to occur

- Maternal anti-D level  
10.5iu/ml
- Unmonitored pregnancy
- Bilirubin reached  
exchange trigger by end  
of day 1

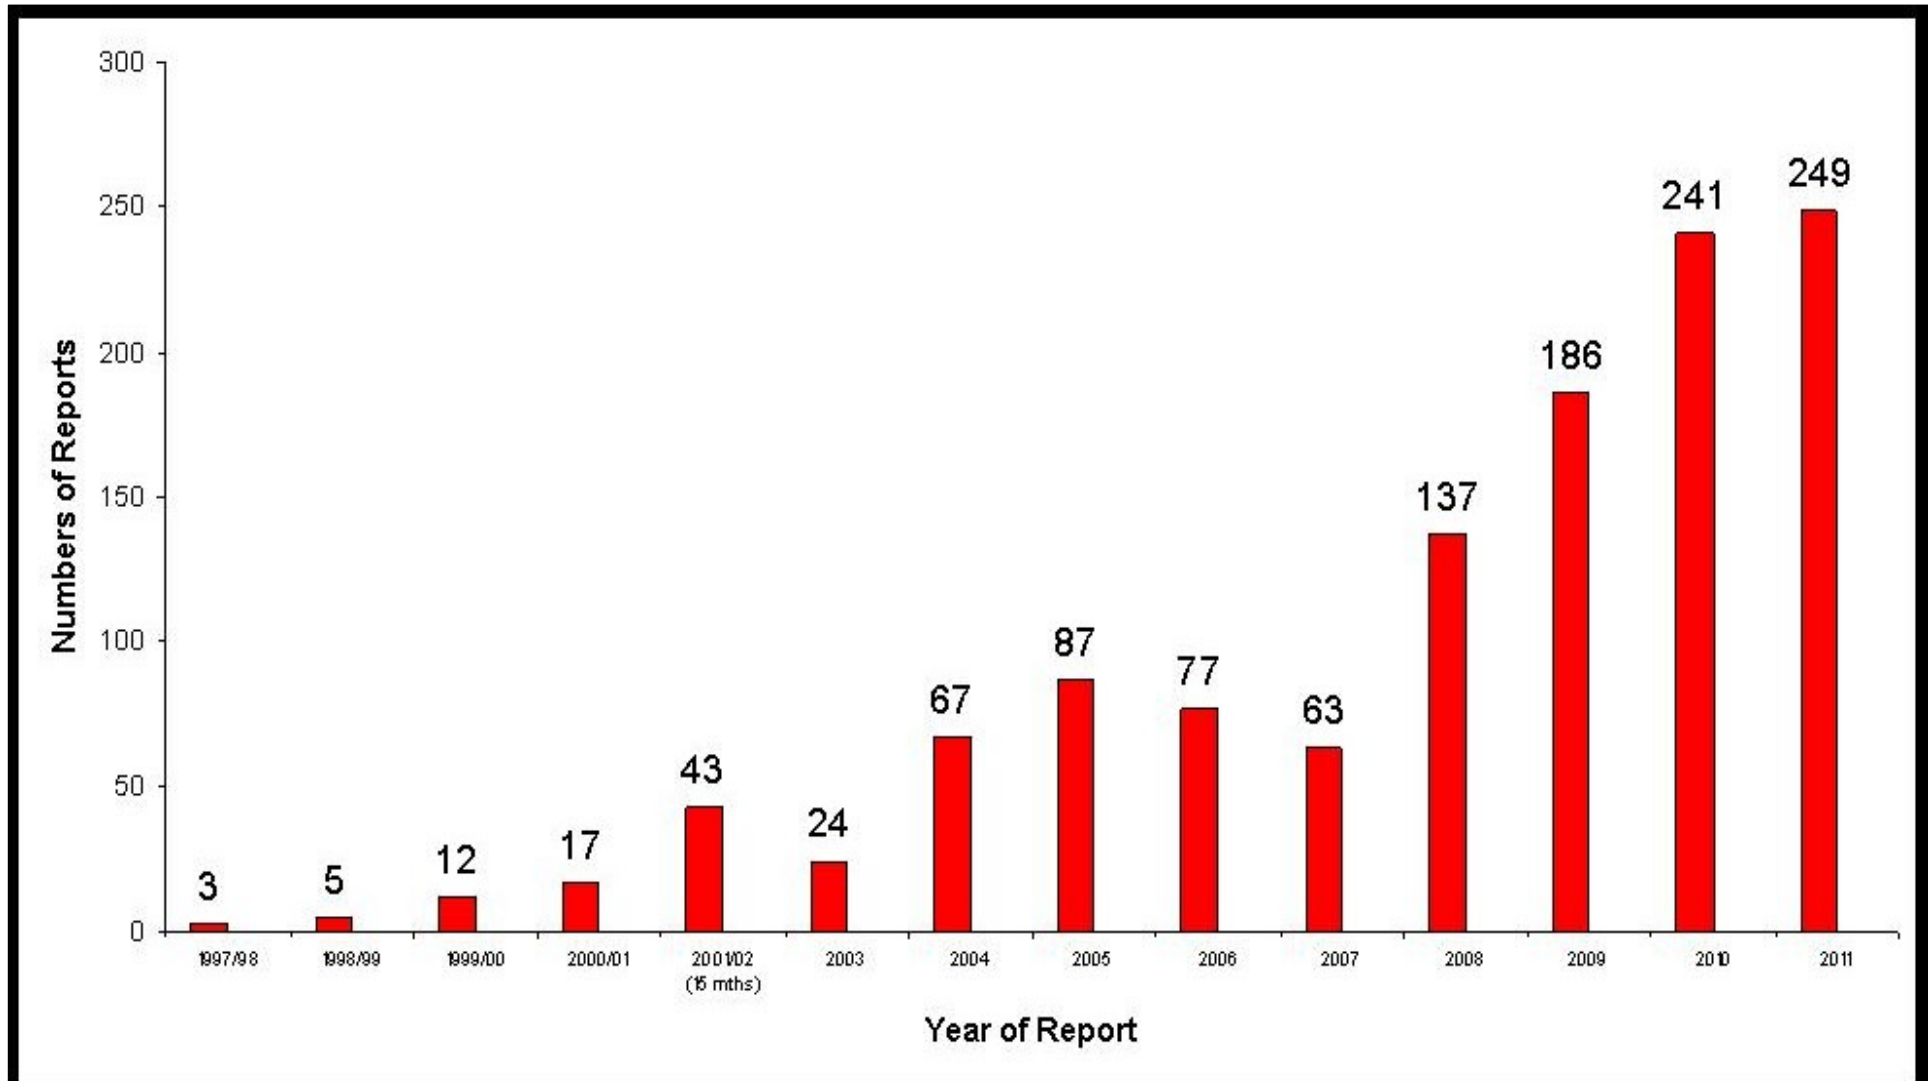

# Anti-D Ig Reporting Categories

- Omission or late administration of anti-D immunoglobulin
- Inappropriate administration of anti-D immunoglobulin to:
  - a RhD positive patient
  - a patient who already has immune anti-D
  - a mother of a RhD negative infant
  - a different patient from the patient it was issued for
- Incorrect dose of anti-D Ig given
- Handling and storage errors
  - administration of expired, or otherwise out of temperature control, anti-D immunoglobulin

# Anti-D Ig cases 1996 - 2011

## Anti-D Ig events in 2011 $n = 249$

- **60** cases where anti-D Ig was inappropriately administered - *unnecessary exposure to a human blood product*
- **157** cases where anti-D Ig was delayed or omitted, putting patient at risk of sensitisation to the D antigen - *potential Major Morbidity*
- **24** cases where the wrong dose of anti-D Ig was administered
- **8** handling and storage errors

# Anti-D Ig....who makes the errors ?

- Midwives **176** (70.5 %)
- Laboratory **59** (24 %)
- Medical staff **14** (5.5 %)

## Lack of knowledge results in delay of administration of anti-D Ig

*A woman presented with a PV bleed at 19 weeks of gestation, but was discharged by a doctor who informed her that anti-D Ig should only be given if a Kleihauer test is positive. The woman was recalled and given anti-D Ig four days later*

## Lack of understanding results in omission of RAADP

*Community midwives at a GP surgery returned a dose of anti-D Ig intended for a woman with the comment “already given in hospital”.*

*The woman had received prophylaxis for a PSE earlier in her pregnancy*

Anti-D Ig administered to a RhD positive woman after grouping results were mis-transcribed into her notes

*Blood grouping results from booking were incorrectly transcribed into a woman's notes and anti-D Ig was issued in response to a sensitising event from stock held in the clinical area*

Poor advice from the laboratory results  
in incorrect route of administration of  
anti-D Ig

*A BMS advised administering a 1500iu dose  
of anti-D Ig intravenously when the product  
(DGAM) issued was licensed only for  
intramuscular injection*

# Anti-D

## When and How Much?

This poster gives recommended dosages of anti-D immunoglobulin at different stages during pregnancy for women with an RhD negative blood type who do not already have immune anti-D antibodies.

### At less than 12 weeks

- Anti-D is NOT usually indicated unless there has been therapeutic termination, molar or ectopic pregnancy, surgical intervention associated with miscarriage, or continued painful vaginal bleeding (request at least 250iu within 72 hours in these cases).

### Between 12 and 20 weeks

- Administer at least 250iu anti-D Ig within 72 hours of a potentially sensitising event.

### Between 20 weeks and delivery

- Administer at least 500iu anti-D Ig within 72 hours of a potentially sensitising event.
- Send a sample for a Kleihauer Test in case additional anti-D Ig is needed.
- Anti-D Ig should be given for potentially sensitising events, even if RAADP has been given already.

### Routine Antenatal Anti-D Prophylaxis (RAADP) should be administered between 28 and 30 weeks

- Send a sample for blood group and antibody screen and then administer RAADP according to local policy, even if anti-D Ig has been recently given for a sensitising event.
- SINGLE DOSE: Administer 1500iu anti-D Ig at 28-30 weeks.
- TWO-DOSE: Administer at least 500iu anti-D Ig at 28 and 34 weeks.

### After delivery

- Send 'Mother & Cord' samples for testing.
- Where the baby is RhD positive, administer at least 500iu anti-D Ig within 72 hours of delivery.
- Administer further anti-D Ig on the advice of the laboratory if the Kleihauer shows a large fetomaternal haemorrhage.

### For further information please refer to your local policy

British Committee for Standards in Haematology (BCSH) Guidelines for the use of prophylactic anti-D immunoglobulin 2006.

Royal College of Obstetricians and Gynaecologists (RCOG) Green Top Guideline No 22 The Use of Anti-D Immunoglobulin for Rhesus D Prophylaxis 2011.

**NHS**  
**Blood and Transplant**

July 2012 Version 2

BLC680.1

1213255

- If outside 72 hrs still give anti-D, as a dose within 9-10 days may provide some protection
- Give RAADP in addition to prophylaxis for sensitising events, and vice versa

**SHOT**

## Anti-D Administration Checklist

DO NOT WRITE IN THESE SPACES **SHOT**

<b>Always confirm</b> <ul style="list-style-type: none"> <li>the woman's identity</li> <li>that the woman is RhD Negative using the latest laboratory report</li> <li>that the woman does not have immune anti-D using the latest laboratory report</li> <li>that informed consent for administration of anti-D Ig is recorded in notes</li> </ul>	
<b>Potentially Sensitising Events (PSEs) during pregnancy</b>	
<b>Gestation LESS than 12 weeks</b>	
Vaginal bleeding associated with severe pain	Administer at least 250iu anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration
ERPC / Instrumentation of uterus	
Medical or surgical termination of pregnancy	
Ectopic / Molar Pregnancy	
<b>Gestation 12 to 20 weeks</b>	
For any Potentially Sensitising Event (PSE)	Administer at least 250iu anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration
<b>Gestation 20 weeks to term</b>	
For any Potentially Sensitising Event (PSE) (Irrespective of whether RAADP has been given)	Request a Kleihauer Test and immediately administer at least 500iu anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration
Does the Kleihauer Test indicate that further anti-D Ig is required?	Administer more anti-D Ig following discussion with laboratory
For continuous vaginal bleeding at least 500iu anti-D Ig should be administered at a minimum of 6-weekly intervals, irrespective of the presence of detectable anti-D, and a Kleihauer Test requested in case more anti-D is required	
<b>Routine Antenatal Anti-D Prophylaxis (RAADP)</b>	
For Routine Antenatal Anti-D Prophylaxis  (Irrespective of whether anti-D Ig already given for PSE)	Take a blood sample to confirm group & check antibody screen – do not wait for results before administering anti-D Ig
	Administer 1500iu anti-D Ig at 28 – 30 weeks
	OR
	Administer at least 500iu anti-D Ig at 28 weeks and then administer at least 500iu anti-D at 34 weeks
Confirm product / dose / expiry and patient ID pre administration	
<b>At Delivery (or Intra Uterine Death &gt;20 weeks)</b>	
Is the baby's group confirmed as RhD positive? OR Are cord samples not available?	Request a Kleihauer Test
Does the Kleihauer Test indicate that further anti-D Ig is required?	Administer at least 500iu anti-D Ig within 72 hours of delivery Confirm product / dose / expiry and patient ID pre administration
	Administer more anti-D following discussion with laboratory

## Anti-D Administration Checklist

#10701000000000000000 **SHOT**

Patient ID	Date of administration	Sign to confirm action	
Blood Group	Confirmation of patient's identity	<input type="checkbox"/>	
	Confirmation that the patient is RhD Negative from latest laboratory report	<input type="checkbox"/>	
	Latest antibody screen checked and confirmed that the patient does not already have her own immune anti-D	<input type="checkbox"/>	
Date	Informed consent for administration of anti-D Ig recorded in notes	<input type="checkbox"/>	
<b>POTENTIALLY SENSITISING EVENTS (PSEs)</b>			
Gestation LESS than 12 weeks	Estimated Gestation	Date	
Any of	Vaginal bleeding associated with severe pain	Administer at least 250 IU anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration	<input type="checkbox"/>
	Ectopic / Molar Pregnancy		
	ERPC / Instrumentation of uterus		
	Medical or surgical termination of pregnancy		
<b>Gestation 12 to 20 weeks</b>		Estimated Gestation	Date
For any Potentially Sensitising Event (PSE)		Administer at least 250 IU anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration	<input type="checkbox"/>
<b>Gestation 20 weeks to term</b>		Estimated Gestation	Date
For any Potentially Sensitising Event (PSE) (Irrespective of whether RAADP is given)		Request a Kleihauer Test but DO NOT wait for results  Immediately administer at least 500 IU anti-D Ig within 72 hours of event. Confirm product / dose / expiry and patient ID pre administration	<input type="checkbox"/>
Does the Kleihauer Test indicate that further anti-D Ig is required?		Administer more anti-D Ig as indicated	<input type="checkbox"/>
For continuous vaginal bleeding at least 500 IU anti-D Ig should be administered at a minimum of 6-weekly intervals, irrespective of the presence of detectable anti-D, and a Kleihauer Test requested in case more anti-D is required			
<b>ROUTINE ANTENATAL ANTI-D PROPHYLAXIS (RAADP)</b>			
For Routine Antenatal Anti-D Ig Prophylaxis (RAADP)  (Irrespective of whether anti-D Ig already given for PSE)	Take a blood sample to confirm group and check antibody screen – DO NOT wait for results		<input type="checkbox"/>
	Administer 1500 IU anti-D Ig at 28–30 weeks		<input type="checkbox"/>
	OR		<input type="checkbox"/>
	Administer at least 500 IU anti-D Ig at 28 weeks and then administer at least 500 IU anti-D Ig at 34 weeks		<input type="checkbox"/>
Confirm product / dose / expiry / and patient ID pre administration		<input type="checkbox"/>	<input type="checkbox"/>
<b>AT DELIVERY (or Intra Uterine Death &gt;20 weeks)</b>			
Is the baby's group confirmed as RhD positive?		Request a Kleihauer Test	<input type="checkbox"/>
OR		Administer at least 500 IU anti-D Ig within 72 hours of delivery Confirm product / dose / expiry and patient ID pre administration	<input type="checkbox"/>
Are cord samples not available?			
Does the Kleihauer Test indicate that further anti-D Ig is required?		Administer more anti-D Ig as indicated	<input type="checkbox"/>

SERIOUS HAZARDS OF TRANSFUSION

**SHOT**

# Anti-D Summary

- Many of the cases involve:
  - failure to follow basic clinical and laboratory protocols
  - clerical / testing errors
  - ignoring / overriding hazard flags on IT systems
  - lack of understanding
- Effective anti-D prophylaxis is a partnership between the laboratory and the clinical area – the clinical area must be responsive to requests for follow-up from the laboratory, and the lab must not assume that action will be taken purely because they have issued a report

# Cell Salvage in Obstetrics

An example of evolving practice, with increasing use of intra-operative cell salvage in the obstetric setting;

- Remember appropriate dosage of anti-D in RhD negative women – *at least* 1500iu following cell salvage reinfusion, more if the Kleihauer indicates it

# Anti-D Recommendations

- Obstetricians / midwives / lab staff must be familiar with national guidance for RAADP
  - HTC / lab must engage with obstetricians and midwives to produce local guidelines
- All organisations issuing anti-D must ensure that their systems are robust with respect to issue, receipt and recording of administration, and should regularly audit their systems
- All staff should complete the anti-D modules on 'Learn Blood Transfusion' e-learning

# Key Messages & Recommendations 2011 – ‘Back to Basics’

- Correct patient ID should be a core clinical skill
- Transfusion checklist – template available  
[www.shotuk.org/resources/current-resources/](http://www.shotuk.org/resources/current-resources/)
- Staff knowledge and competency – knowledge should underpin practice
- Prescribing/authorisation knowledge
- Comprehensive clinical and transfusion laboratory handover templates

# Resources from your regional NHSBT Transfusion Liaison Nurse /Practitioner

- Will I need a blood transfusion?
- **Iron in your diet**
- Information for patients needing irradiated blood
- Receiving a plasma transfusion
- **Blood group and red cell antibodies in pregnancy**
- **Anti-D – when and how much ?**
- Children's leaflets
- Educational posters
